ENABLE VENTURES INVESTOR OUTREACH

SAMMY — Cold Email Evolution Dossier

Founder: Iniyan Andrews Joseph
Company: SAMMY Technologies
Target: Enable Ventures Fund I (Gina, Jim, Charlotte)
Date: October 22, 2026

Executive Note & Purpose: Over several iterations, our outreach has evolved from a bloated, speculative ~800-word academic proposal into a razor-sharp, ~230-word institutional email. This document compiles all 6 historical and working versions side-by-side with editorial critiques, enabling you to compare wording, understand why specific claims were dropped, and select the final version with 100% confidence.

Version	Word Count	Core Framing	Key Red Flags Removed	Status
v1. Kitchen-Sink Pitch	~820 words	Deep-tech academic thesis	Sorenson synergy, $43k fines, $25B TAM, raw LaTeX leaks	REJECTED
v2. Structured 5-Section	~550 words	Mini-memo in email body	Embedded report style, unstated exit assumptions	DEPRECATED
v3. 250-Word Enable Pitch	~245 words	Disability wealth-gap fit	"Expand" lexicon overclaim, unconstrained generative claim	TRANSITIONAL
v4. Founder Passion Draft	~250 words	High founder enthusiasm	Overly eager open scheduling, lacked community framing	TRANSITIONAL
v5. Accessibility / Lexicon	~240 words	Accessibility startup (AI-assisted)	Unconstrained black-box AI, ungrounded gloss translation	TRANSITIONAL
v6. Direct Milestone Pitch	~230 words	Statutory compliance & de-risking	Compact direct ask without spatial medium rationale	ALTERNATIVE
v7. Tripartite & Spatial Medium	~268 words	Tripartite Architecture (Airport-focused)	Grounded in 3-pillar method, but read like an airport-only product	TRANSITIONAL
v8. Universal Bidirectional Platform	~375 words	Universal Platform • 4-in-1 Venture Asymmetry	Concise executive pitch • Protocol moat, Ava synergy, $5M SAFE cap • Prototype honesty	ALTERNATIVE (SHORT)
v9. Personal Letter to Regina Kline	**~485 words**	**Full Narrative • Protocol Moat • Ava Synergy • Pre-Seed SAFE**	**Personal to Gina Kline; 4-in-1 Venture Asymmetry (Protocol moat, 14 CFR § 382 liability, Ava portfolio synergy, $5M valuation floor)**	RECOMMENDED (FULL NARRATIVE)

RECOMMENDED (DEEP PARTNER NARRATIVE)

Version 9: Personal Partner Letter to Regina Kline

Length: 485 Words • Reading Time: ~110 sec

STRATEGIC BREAKTHROUGH & FUTURE ROADMAP TENSE:

•

ROADMAP TENSE & PROTOTYPE HONESTY:

Clarifies that the 27-DOF WebGL engine is a live 34-sign prototype, while neural humanization and sign-to-text perception are future milestones funded by this round.

•

THE VENTURE ASYMMETRY (THE 4-IN-1 REASON TO INVEST EARLY):

Synthesizes (1) Protocol Moat (Big Tech pixel diffusion fails; SAMMY builds the kinematic compiler), (2) Regulatory Wedge (14 CFR § 382.53 creates enterprise liability with zero dynamic software to buy), (3) Portfolio Synergy with Ava (text captions + 3D spatial sign completes the stack), and (4) Pre-Seed Valuation Asymmetry ($1M on $5M cap before airport trial re-rates the company).

•

STAGE FIT HONESTY:

Explicitly acknowledges to Gina that a pre-revenue, 34-sign prototype is earlier than Enable's typical Seed/Series A check, positioning the ask as an early catalytic partnership.

EXPLICIT DEAL TERMS & PARTICIPATORY CO-DESIGN:

•

EXPLICIT DEAL STRUCTURE:

States terms as a **$1M PRE-SEED ON A POST-MONEY SAFE ($5M CAP)** .

•

HEARING FOUNDER HUMILITY & DEAF LEADERSHIP:

Replaces outside "audit" slogans with a direct commitment: allocating $100,000 to hire native Deaf linguists and recruit a Deaf co-designer into core team leadership before commercial gate deployment.

• Disaggregates TAM into $144M aviation beachhead + $90M hospital ER triage under compliance-driven budgets.

Subject: Real-time 3D sign language: why we rejected gloves, studio mocap, and cloud GPUs to build with the community

Dear Gina (and the Enable Ventures team),

I am writing to you directly because of your background in civil rights enforcement at the DOJ and Enable's thesis: that disability-led technology is not charity—it is an engine for high-growth enterprise infrastructure.

When I began this work, academic researchers told me sign language translation was a "solved and saturated problem." But national Deaf associations and researchers shared a very different reality. The community is exhausted by student "AI gloves" that identify twenty signs, robotic avatars with uncanny-valley stiffness, and tech tourists who refuse to fund basic linguistic lexicons. Furthermore, incumbent avatar pilots are economically broken: they spend hundreds of thousands recording actors in optical motion-capture (mocap) studios, locking them to rigid pre-recorded clips, and burn expensive cloud GPUs streaming heavy MP4 video to screens.

We are building SAMMY as a universal, bidirectional 3D sign language infrastructure designed to eliminate both the mocap studio and the cloud GPU. Our architecture decouples sign into three distinct systems:

1. 3D Kinematic Engine (Live Prototype): A deterministic 27-DOF skeletal rig that procedurally compiles text and phonological lexicons (HamNoSys, ASL-LEX 2.0) into exact joint movements at 60 FPS in WebGL—requiring zero mocap studio recording.
2. Neural Humanization (Milestone 2): Layers realistic micro-dynamics, facial Action Units, and emotion over the physical skeleton to eliminate robotic uncanny-valley artifacts.
3. Sign-to-Text Perception (Milestone 3): Reads consumer video to track 3D hands and facial markers, translating continuous signing back into spoken text.

Our architectural breakthrough is economic: instead of streaming heavy video from cloud GPUs, SAMMY will only transmit lightweight JSON motion tokens (~5 KB) over the network. Existing low-power gate screens will render continuous 3D sign locally at 60 FPS in WebGL, cutting live cloud GPU rendering fees and slashing bandwidth costs by 95%+.

Our business model is high-margin enterprise B2B funded by compliance-driven budgets—starting with an estimated $144M commercial aviation beachhead (modeled across 15,000 domestic gates at $800/month) under 14 CFR § 382.53(a)(3), with an

expansion into hospital ER triage ($90M). The consumer app will stay permanently free for Deaf travelers, supporting Enable's thesis of closing the disability wealth gap.

As a hearing founder, I know this cannot be built from the outside. We are dedicating $100,000 of this round to compensate native Deaf linguistic researchers and bring a Deaf co-designer into core leadership before deploying to any commercial gate.

Why take this risk early: The risk at pre-seed is engineering execution; the asymmetry is category ownership. While Big Tech burns capital on generative video models that hallucinate fingers and legacy avatars stay trapped in mocap studios, transit operators face federal compliance mandates under 14 CFR § 382 with zero dynamic software to buy. Just as Enable backed Ava for text captions, SAMMY completes the stack for native 3D spatial sign. Backing us at our $5M pre-seed cap secures ground-floor ownership of the foundational kinematic compiler before our first live airport trial re-rates the company.

We are raising a $1M Pre-Seed on a post-money SAFE ($5M cap) to build our 500-phrase Deaf-reviewed airport lexicon, integrate facial grammar, and complete a first commercial gate trial.

I recognize that a 34-sign prototype with no commercial revenue is earlier than Enable's typical check (you often back companies with seed or Series A traction). But Enable is the only fund that truly understands spatial language and disability infrastructure from Day 0. If this is too early for a lead check, I would value the chance to demonstrate the kinematic prototype and stay on your radar as we hit these milestones.

Demo (45s): https://joeytribb.github.io/sign-language-kinematics/?v=5

Because sign language is an embodied 3D language, flat text cannot do justice to the spatial engine. Could we do 15 minutes on Tuesday, Oct 27 at 10:00 AM ET (7:30 PM IST) or Thursday, Oct 29 at 2:00 PM ET (11:30 PM IST)?

Warm regards,

Iniyan Andrews Joseph
Founder, SAMMY
iniyandrews@gmail.com | +91-9399258854

VERSION 8

Version 8: Universal Bidirectional Platform & Beachhead Wedge

Length: 375 Words • Reading Time: ~90 sec

STRATEGIC STRENGTHS:
Concise, highly disciplined 375-word executive note positioning commercial aviation as the initial beachhead wedge for a universal bidirectional engine.

HONEST STAGE & VENTURE ASYMMETRY:
Explicitly synthesizes the 4-in-1 risk rationale (Protocol Moat, Regulatory Wedge, Ava Synergy, and Pre-Seed Valuation Asymmetry). States the terms clearly:
$1M PRE-SEED ON A POST-MONEY SAFE ($5M CAP)
.

Subject: Bidirectional 3D sign language infrastructure: airport beachhead, Deaf-reviewed roadmap

Dear Gina, Jim and Charlotte,

Congratulations on closing Fund I. Your thesis that disability-inclusive design expands markets is why I am writing.

While commercial airports represent our initial beachhead due to federal flight information mandates (14 CFR § 382.53(a)(3)), we are building SAMMY as a universal, bidirectional 3D sign language infrastructure for any domain—translating spoken language into continuous 3D sign, and vice versa.

Unlike incumbent avatars that require expensive optical mocap studio recording and stream heavy cloud-GPU video, our architecture procedurally synthesizes open-domain signs directly from phonological lexicons (HamNoSys, ASL-LEX 2.0). By streaming lightweight JSON motion packets (~5 KB) instead of video, existing gate displays will render continuous 3D sign at 60 FPS in WebGL—eliminating live cloud GPU rendering fees and cutting bandwidth costs by 95%+.

We are developing this through a tripartite architecture:
1. 3D Kinematic Engine (Live Prototype): A deterministic 27-DOF skeletal rig compiling text into 3D movements with zero hallucinations and zero mocap recording.
2. Neural Humanization (Milestone 2): Eliminates the robotic Uncanny Valley through facial Action Units and expressive dynamics.
3. Sign-to-Text Perception (Milestone 3): Translates continuous visual signing from consumer cameras back into spoken text.

As a hearing founder, I know this cannot be built from the outside. We dedicate $100,000 of our round to pay native Deaf linguistic researchers and recruit a Deaf co-designer into core leadership. The consumer app will stay permanently free for Deaf travelers; enterprise transit and healthcare operators pay.

Why back SAMMY early: The risk is engineering execution; the asymmetry is category ownership. While Big Tech burns capital on generative video models that hallucinate fingers, airports face 14 CFR § 382 compliance with zero dynamic software to buy. Just as Enable backed Ava for text captions, SAMMY completes the stack for native 3D spatial sign—offering ground-floor ownership of the kinematic standard at a $5M cap before our live gate trial re-rates the company.

We are raising a $1M Pre-Seed on a post-money SAFE ($5M cap). While a 34-sign prototype is earlier than Enable's typical check, your fund is the only one with the depth to understand spatial language infrastructure from Day 0.

Demo (45s): https://joeytribb.github.io/sign-language-kinematics/?v=5

Because sign language is an embodied, 3D spatial language with no written orthography, flat text cannot do justice to the broader bidirectional vision or engine mechanics. A 15-minute video call is the best way to walk you through the kinematics and roadmap live.

Could we connect on Tuesday, Oct 27 at 10:00 AM ET (7:30 PM IST) or Thursday, Oct 29 at 2:00 PM ET (11:30 PM IST)?

Best regards,

Iniyan Andrews Joseph
Founder, SAMMY

VERSION 7

Version 7: The Tripartite Architecture (Airport-Only Framing)

Length: 268 Words • Reading Time: ~70 sec

STRATEGIC STRENGTHS:
First draft to introduce the 3-step Tripartite Architecture and the spatial medium justification for a video call.

LIMITATION VS V8:
Framed the technology as if it were only for airport gate changes, obscuring the universal, bidirectional platform capability.

Subject: Real-time sign language for airport gate changes: prototype, Deaf-reviewed roadmap

Dear Gina, Jim and Charlotte,

Congratulations on closing Fund I. Your thesis that disability-inclusive design expands markets is why I am writing.

Deaf travelers can miss urgent gate changes because airport announcements are acoustic. Under 14 CFR § 382.53(a)(3), carriers and airports that control gates share responsibility for giving passengers who identify as needing assistance prompt access to the same flight information.

Deaf communities we consulted were clear: do not treat our language with unconstrained black-box AI. SAMMY is an accessibility startup assisted by AI, not an AI video experiment. We solve sign synthesis through a deterministic tripartite architecture:

1. Linguistic Lexicon: Maps flight announcements into validated phonological parameters (HamNoSys, ASL-LEX 2.0).
2. Spatial Syntax Engine: Converts linear English into natural sign grammar (Time-Topic-Comment) with 3D spatial coordinate anchors.
3. Analytical Kinematics: A 27-DOF active skeletal rig executes continuous motion at 60 FPS directly in browser WebGL.

This eliminates server GPU costs, runs on existing gate displays, and guarantees consistent, repeatable signing without hallucinations. The application will stay permanently free for Deaf travelers; enterprise airports and carriers pay.

I'm Iniyan Andrews Joseph, founder of SAMMY. We are raising $500K on a post-money SAFE ($5M cap). This round funds three milestones that retire our biggest unknowns: building a Deaf-reviewed lexicon of 500 airport phrases, facial grammar, and a first commercial gate trial.

Demo (45s): https://joeytribb.github.io/sign-language-kinematics/?v=5

Because sign language is a 3D spatial language with no written orthography, text cannot do justice to the broader vision and engine mechanics. A 15-minute video call is the best way to walk you through the kinematics and roadmap live.

Could we connect on Tuesday, Oct 27 at 10:00 AM ET (7:30 PM IST) or Thursday, Oct 29 at 2:00 PM ET (11:30 PM IST)?

Best regards,

Iniyan Andrews Joseph
Founder, SAMMY

VERSION 6

Version 6: The Direct Milestone Pitch

Length: 232 Words • Reading Time: ~60 sec

STRATEGIC STRENGTHS:

• Uses verbatim statutory text: 14 CFR § 382.53(a)(3) ("the same flight information").
• Replaces "expand" with "build a Deaf-reviewed lexicon of 500 airport phrases".
• Explains text-to-sign pipeline cleanly (phonological mapping → 27-DOF WebGL rig).
• Ultra-compact direct ask.

DISTINCTION FROM V7:

Concludes directly with the scheduling question without explaining why text is inadequate for a 3D spatial language.

Subject: Real-time sign language for airport gate changes: prototype, Deaf-reviewed roadmap

Dear Gina, Jim and Charlotte,

Congratulations on closing Fund I. Your thesis that disability-inclusive design expands markets is why I am writing.

Deaf travelers can miss urgent gate changes because airport announcements are acoustic. Under 14 CFR § 382.53(a)(3), carriers and airports that control gates share responsibility for giving passengers who identify as needing assistance prompt access to the same flight information.

Deaf communities we consulted were clear: do not treat our language with unconstrained black-box AI. SAMMY is an accessibility startup assisted by AI, not an AI video experiment. We map templated flight announcements into validated phonological parameters (HamNoSys, ASL-LEX 2.0), then render them through a 27-DOF active kinematic rig running at 60 FPS directly in the browser. This eliminates server GPU costs and guarantees consistent, repeatable signing without hallucinations.

The application will stay permanently free for Deaf travelers; enterprise airports and carriers pay.

I'm Iniyan Andrews Joseph, founder of SAMMY. We are raising $500K on a post-money SAFE ($5M cap). This round funds three milestones that retire our biggest unknowns: building a Deaf-reviewed lexicon of 500 airport phrases, facial grammar, and a first commercial gate trial.

Demo (45s): https://joeytribb.github.io/sign-language-kinematics/?v=4

Could we do 15 minutes on Tuesday, Oct 27 at 10:00 AM ET (7:30 PM IST) or Thursday, Oct 29 at 2:00 PM ET (11:30 PM IST)?

Best regards,

Iniyan Andrews Joseph
Founder, SAMMY
iniyandrews@gmail.com | +91-9399258854

VERSION 5

Version 5: The "Accessibility Startup" Pivot

Length: 242 Words • Reading Time: ~65 sec

KEY BREAKTHROUGH:

Introduced the Deaf community feedback: explicitly stating SAMMY is an accessibility startup assisted by AI, not an unconstrained black-box video AI company.

REMAINING FLAWS (FIXED IN V6):

Still had "expand our Deaf-reviewed lexicon" (premature), "invariant bone lengths" (unnecessary jargon), and exposed public GitHub repo link.

Subject: Real-time sign language for airport gate changes: prototype, Deaf-reviewed roadmap

Dear Gina, Jim and Charlotte,

Congratulations on closing Fund I. Your thesis that disability-inclusive design expands markets is why I am writing.

Deaf travelers frequently miss urgent gate reassignments because airport announcements are acoustic. Under 14 CFR § 382.53(a)(3), carriers and airports share responsibility for giving deaf passengers prompt, equivalent access to the same flight information.

In our consultations with Deaf communities, the mandate was unequivocal: never use unconstrained black-box AI on natural sign languages. SAMMY is an accessibility startup assisted by AI, not an AI video experiment. Instead of guessing pixels, we ground every sign in validated phonological lexicons (HamNoSys, ASL-LEX 2.0) and deterministic 3D kinematics.

Our prototype compiles announcements into a 27-DOF active kinematic rig running at 60 FPS directly in the browser—with zero server GPU costs and invariant bone lengths. The app will stay permanently free for Deaf travelers; enterprise airports and carriers pay.

I'm Iniyan Andrews Joseph, founder of SAMMY. We are raising $500K on a post-money SAFE ($5M cap) to expand our Deaf-reviewed lexicon to 500 airport phrases, add facial grammar, and deploy a first gate trial.

I am deeply excited about bringing this accessibility infrastructure to life and would value your feedback and perspective.

Demo (45s): https://joeytribb.github.io/sign-language-kinematics/?v=3
Code: https://github.com/Joeytribb/sign-language-kinematics

Could we do 15 minutes on Tuesday at 10:00 AM ET or Thursday at 2:00 PM ET?

Best regards,

Iniyan Andrews Joseph
Founder, SAMMY

VERSION 4

Version 4: The Founder Passion & Open Availability Draft

Length: 255 Words • Reading Time: ~70 sec

INTENT:
Tested expressing pure founder passion and unrestricted willingness to jump on a call at any time that suited the investor.

WHY IT WAS REVISED:
Saying "open to a meeting anytime that suits you" reads as overly eager or unfocused. Professional investors respond better to two concrete slots.

Subject: Real-time 3D sign language for airport gate changes: $500K pre-seed

Dear Gina, Jim and Charlotte,

Congratulations on closing Fund I. Your thesis that disability-inclusive design expands markets, rather than just serving a cause, is why I am writing to you directly.

Deaf travelers frequently miss gate changes because flight announcements are acoustic. Carriers and airports that control gates share explicit responsibility to provide hearing-impaired passengers prompt access to the same information under 14 CFR § 382.53(a)(3).

SAMMY renders flight updates as 3D sign language directly in the browser, with no server-side video streaming, so it runs on existing terminal displays for $0.00 cloud inference cost. Our working prototype executes a 27-DOF active kinematic rig across 34 audited signs at 60 FPS. Next, we are building a Deaf-reviewed lexicon, integrating facial grammar, and deploying our first airport gate pilot.

The consumer app will stay permanently free for Deaf travelers; enterprise airlines and airports pay recurring SaaS fees.

I am Iniyan Andrews Joseph, founder of SAMMY. We are raising $500K on a post-money SAFE ($5M cap). I am so deeply excited about bringing this technology to life that I would welcome 15 minutes of your time whenever works for your schedule.

Demo (45s): https://joeytribb.github.io/sign-language-kinematics/
GitHub: https://github.com/Joeytribb/sign-language-kinematics

Would you have 15 minutes to connect this week or next?

Warm regards,

Iniyan Andrews Joseph

VERSION 3

Version 3: The 250-Word Enable Thesis Compression

Length: 248 Words • Reading Time: ~65 sec

BREAKTHROUGH:
First draft that cut the 800-word essay down to a readable size, explicitly introducing the $500K SAFE on $5M cap and the 14 CFR § 382.53 citation.

FLAWS:
Still had contradictory claims ("zero hallucinations" alongside neural variation layers) and had not yet integrated the "accessibility startup" distinction.

Subject: Real-time sign language for airport gate changes: prototype, Deaf-reviewed roadmap

Dear Gina, Jim and Charlotte,

Congratulations on closing Fund I. Your thesis that disability-inclusive design expands markets, not just serves a cause, is why I'm writing.

Deaf travelers miss gate changes because airport information is built for hearing passengers. Carriers and airports that control gates share responsibility for giving hearing-impaired passengers prompt access to the same flight information (14 CFR § 382.53(a)(3)).

SAMMY renders announcements as 3D sign language in the browser, with no server-side video, so it can run on existing displays. The prototype runs a 27-DOF rig at 60 FPS across 34 signs. Next: a Deaf-reviewed lexicon, facial grammar, and a first gate trial. The app will stay free for Deaf users; airports and carriers pay.

I'm Iniyan Andrews Joseph, founder of SAMMY. We're raising $500K on a post-money SAFE ($5M cap); I'd value your feedback and any intros even if the stage is early for you.

Demo (45 s): https://joeytribb.github.io/sign-language-kinematics/

Could we do 15 minutes on Tuesday at 10:00 AM ET or Thursday at 2:00 PM ET?

Best regards,

Iniyan Andrews Joseph

VERSION 2

Version 2: The Structured 5-Section Mini-Memo

Length: ~550 Words • Reading Time: ~2.5 min

INTENT:

Attempted to structure the email as a numbered tear sheet covering Problem, Method, Economics, Thesis Fit, and Use of Funds.

WHY IT FAILED:

Too long for an executive cold email. Investors felt like they were reading a pitch memo inside their inbox rather than a quick intro note.

Subject: SAMMY // Enable Ventures Seed Teaser: Real-Time 3D Sign Language Infrastructure

Dear Enable Ventures Team,

We are developing SAMMY: deterministic, edge-rendered 3D sign language infrastructure for commercial airport gate changes and healthcare triage.

1. THE FORCING FUNCTION & PROBLEM
Over 70 million Deaf individuals communicate primarily via visual-gestural sign language. In transit environments, gate reassignments and delays are broadcast acoustically. Under 14 CFR § 382.53, air carriers and airports share statutory liability to provide prompt flight information. Certified human interpreters cost $150+/hr and cannot staff 15,000 gates 24/7. Generative video diffusion models (Sora, Runway) suffer from topological hallucinations, 20-second latencies, and $0.20/query costs.

2. THE METHOD: NEURO-SYMBOLIC KINEMATICS
SAMMY combines phonological grounding (HamNoSys, ASL-LEX 2.0) with an analytical 27-DOF inverse kinematics solver. Signs render at 60 FPS in WebGL directly on client hardware with zero cloud compute cost and 0.0mm bone stretching drift.

3. BOTTOM-UP BEACHHEAD TAM & ECONOMICS
- 15,000 US Airline Gates @ $800/mo = $144M ARR
- 5,000 Emergency ER Kiosks @ $1,500/mo = $90M ARR
- Combined Initial Beachhead = $234M ARR
- 1.0% Beachhead Penetration = $2.34M ARR

4. DOUBLE BOTTOM LINE & THE DISABILITY WEALTH GAP
Consistent with Enable Ventures' thesis, SAMMY is 100% free for Deaf signers. Operations are funded strictly through enterprise B2B compliance contracts paid by airlines and hospital operators.

5. $500K PRE-SEED USE OF FUNDS (18-MONTH RUNWAY)
- $150K: Core engineering team (Founder + 4 engineers in India)
- $50K: Deaf-reviewed linguistic audit contracts & 3D asset rigging
- $50K: GPU compute & kinematic model calibration
- $75K: US airport gate pilot deployment & VPAT audit
- $175K: Legal, patents, and cash reserve buffer

Demo: https://joeytribb.github.io/sign-language-kinematics/

Could we schedule a brief 15-minute call next week to share our milestone roadmap?

Best regards,
Iniyan Andrews Joseph

VERSION 1 (UNFILTERED)

Version 1: The Initial Kitchen-Sink Pitch

Length: ~820 Words • Reading Time: ~3.5 min

FATAL FLAWS PRESENT:

- Sorenson VRS synergy proposal (undermined independence).
- Unsourced $43,792 fine penalty claims.
- Inflated $25.1B TAM assertions.
- Leaked raw LaTeX equations (\texttt{MOTHER}, $\Delta \equiv 0.000$, M_t).
- Flattery of generalist vs disability investors.

VERDICT:

Completely unsuitable for cold outreach. Looked like a cut-and-paste academic grant application.

Subject: Investment Opportunity: SAMMY - Universal 3D Sign Language Infrastructure (Seed Round)

Dear Gina, Jim, and Charlotte,

Enable Ventures is one of the very few venture funds who truly understand that disability accessibility is not charity, but an uncontested $25.1 Billion enterprise compliance market. While generalist investors overlook the disability wealth gap, we are writing to you because your Fund I thesis directly matches what we have built.

Deaf travelers face extreme discrimination and missed flights every day. Airlines face statutory penalties of up to $43,792 per violation under DOT mandates (14 CFR § 382.57). Sorenson VRS and traditional video relay services are completely overwhelmed, with human interpreters charging $150–$300/hour and requiring 48-hour advance notice. Staffing 15,000 gates across US airports with human interpreters would cost billions annually.

Meanwhile, Big Tech generative video models (OpenAI Sora, Runway Gen-3) are completely unusable. They cost $0.15–$0.30 per query, introduce 20-second latencies, and constantly hallucinate dislocated fingers and rubber-band bones.

SAMMY solves this with a deterministic 125-DOF kinematic engine. By compiling universal phonological tokens ($\langle H, L, M, O, \text{FNMS} \rangle$) with circle-swivel analytical inverse kinematics, SAMMY achieves studio-grade linguistic fidelity, zero hallucinations, and 100% Euclidean bone-length invariance ($\Delta \equiv 0.000$). Signs like \texttt{MOTHER} and \texttt{FATHER} maintain exact millimetric precision. Furthermore, our engine runs in-browser at 60 FPS with $0.00 cloud GPU cost and 90%+ gross margins.

We are raising $500,000 for a 10% equity stake, offering Enable Ventures an expected return of 4.7x–5.6x on this beachhead alone.

Our use of funds:
- $150K: Deaf-led linguistic engineering team and lab hardware
- $50K: Machine learning compute
- $50K: 3D rigging and FACS blendshapes
- $75K: Tier-1 US airport kiosk pilot deployment
- $175K: US legal, patents, and 18-month cash reserve

Our 3D avatar engine is live at: https://joeytribb.github.io/sign-language-kinematics/
Our 14-page technical proposal is attached.

We are literally available any time for a call.

Sincerely,
Iniyan Andrews Joseph
